

Hello, my name is Austin Lee and for my discord bot I would like the user to type / "slash" a command over the emojis. From there the user will be prompted with one default command called /GetStarted. Once the user types /GetStarted in the default channel for class selection, they will be prompted with a list of commands they can use to help join a class. So, for example one of the commands would be /join then the user will type space with the class number and can be followed with a comma then a space with another class number to join more than one class. Another command /ClassRequest Name would ping the server admin and would let them know that you are unsure of what classes you are signed up for and they would read the name and message the user back and saying what class numbers they need to type to join a class. Once the user has joined a class, they will be given a set of new commands that are related to the class they are in. For example, one command would be /ClassTime and the bot would print out the time of the class and a link to the zoom call. Another command when inside of a class would be /CreateStudy name #time this would create a temporary chat room that would allow students to meet up and study together for however long the #time is set to and will be named whatever the user types. The next command inside of a class would be /assignments, this would show the user of upcoming homework and when it is due. On the admin side there will be a few commands that allow the creation of classes, create teams, banning/kicking of users.
